

Southwick Community Primary School

Calculation Policy

A helpful guide to progressive maths teaching

Understanding the number system

A key priority of our maths curriculum is to ensure that children develop a strong sense of number and place value. Children will continually encounter numbers in the world around them, whether that be on the bus they took to school this morning or on their front door at home. But the ability to recognise the symbol 5, and name it, is very different from understanding the 'fiveness' of it, and it is the development of this latter skill that is crucial to a child's mathematical ability.

Furthermore, it is important to recognise that just because a child can recite number names in order, does **not** necessarily mean that they can count. As with learning the alphabet, children can recall a sequence of numbers by rote without any real grasp or understanding of what they mean (hence young children often omit numbers as they count). Gaining familiarity with number names through songs and rhymes is of course helpful, but emphasis should be placed on helping children make links between these number names and the number of objects they equate to.

An intuitive sense of number begins at a very early age, and even before they start school, many children can identify one, two or three objects in a group, regardless of whether they can count. This ability to instantly compute the total in a small group of objects derives from stable, mental images of number which have developed over time from a variety of experiences with different patterns of number. For example, a child might immediately recognise the 6 on a dice, domino piece or playing card:

It is possible that the child has memorised this familiar arrangement of 6 dots.

Alternatively, they may have mentally sub-grouped them into two sets of 3, fostering an understanding that a number can be composed of smaller parts. In both cases, no actual counting of objects is involved; instead, the child has relied on other mental strategies.

At Southwick, we follow the National Curriculum and have created our own long term plan.

Mathematics long term planning overview

Year 1 Place value (within 10) Addition and subtraction (within 10) Shape Place value (within 20) Addition and subtraction (within 20) Place value (within 50) Length & height Mass & volume Multiplication & division Fractions Position & direction Place value (within 100) Money Time	Year 2 Place value Addition and subtraction Shape Money Multiplication & division Length & height Mass, capacity & temperature Fractions Time Statistics Position & direction
Year 3 Place value Addition and subtraction Multiplication and division Length and perimeter Fractions A Mass & capacity Fractions B Money Time Shape Statistics	Year 4 Place value Addition and subtraction Measurement – Area Multiplication and division Length and perimeter Fractions Decimals Money Time Shape Statistics Position and direction
Year 5 Place value Addition and subtraction Multiplication and division A Fractions A Multiplication and division B Fractions B Decimals & percentages Perimeter & area Statistics Shape Position and direction Decimals Negative numbers Converting units Volume	Year 6 Place value Addition and subtraction Multiplication and division Fractions Converting units Ratio Algebra Decimals Fractions, decimals and percentages Area, perimeter & volume Statistics Shape Position & direction Consolidation

Know and use numbers in the Early Years Foundation Stage:

In the Foundation Stage, as well as teaching the children to count objects, number recognition and the development of mental representations are key. In order to do this, much of their experience with number play in the early years will involve concrete, movable objects.

Use of **Numicon** is another great way to help children develop mental representations of number.

These experiences and number representations will help children:

- Count reliably with numbers from one to 20.
- Reliably count the number of objects in a set using the numbers one to twenty.
- Place numbers in order to 20.
- Say which number is one more or one less than a given number.
- Use objects to add two single-digit numbers by counting on to find the answer.

Key Stage One – Addition

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of addition. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Within this milestone children should:

- Have multiples experiences embedding the CPA approach to ensure conceptual understanding.
- Have access to number tracks, bead strings, number lines, diennes, place value counters, place value arrow cards, tens frame, Numicon, counting sticks, 100 squares, bar models and part whole models.
- Have access to a mathematical display highlighting the key vocab add, addition, plus, count on, total, sum, altogether, increase, more.

Concrete	Pictorial	Abstract
Combining two parts to make a whole (use other resources too e.g. eggs, shells, teddy bears, cars). 	Children to represent the cubes using dots or crosses. They could put each part on a part whole model too. 	$4 + 3 = 7$ Four is a part, 3 is a part and the whole is seven. 
Counting on using number lines using cubes or Numicon.  	A bar model which encourages the children to count on, rather than count all. 	The abstract number line: What is 2 more than 4? What is the sum of 2 and 4? What is the total of 4 and 2? $4 + 2$ 
Regrouping to make 10; using ten frames and counters/cubes or using Numicon. $6 + 5$ 	Children to draw the ten frame and counters/cubes. 	Children to develop an understanding of equality e.g. $6 + \square = 11$ $6 + 5 = 5 + \square$ $6 + 5 = \square + 4$

Use numbered number lines to add, by counting on in ones. Encourage children to start with the **larger** number and count on.

Begin with the CPA approach with partitioning of 2 digit numbers.

10 + 0 using base 10. Continue to develop understanding of partitioning and place value. 41 + 8 	Children to represent the base 10 e.g. lines for tens and dot/crosses for ones. 	
--	--	---

Addition skills will be broken down into adding 2-digit numbers and tens and also adding 2-digit numbers and ones, ensuring children have a full understanding of the process using the appropriate resources and method.

If necessary, children to record addition by partitioning and recombining to get the answer:

$$32 + 14 =$$

$$30 + 10 = 40$$

$$2 + 4 = 6$$

$$(40 + 6 = 46)$$

Add pairs of 2-digit numbers, moving to the partitioned column method when secure adding tens and ones following the CPA approach:

Step 1: Expanded column addition – no regrouping:

23 + 34:

20	+	3	
+ 30	+	4	
50	+	7	
		=	<u>57</u>

Step 2: Expanded column addition – with regrouping:

58 + 43:

50	+	8	
40	+	3	
90	+	11	
		=	<u>101</u>

Children must also have a secure and rapid recall and understanding of these additive facts:

+	0	1	2	3	4	5	6	7	8	9	10
0	0+0	0+1	0+2	0+3	0+4	0+5	0+6	0+7	0+8	0+9	0+10
1	1+0	1+1	1+2	1+3	1+4	1+5	1+6	1+7	1+8	1+9	1+10
2	2+0	2+1	2+2	2+3	2+4	2+5	2+6	2+7	2+8	2+9	2+10
3	3+0	3+1	3+2	3+3	3+4	3+5	3+6	3+7	3+8	3+9	3+10
4	4+0	4+1	4+2	4+3	4+4	4+5	4+6	4+7	4+8	4+9	4+10
5	5+0	5+1	5+2	5+3	5+4	5+5	5+6	5+7	5+8	5+9	5+10
6	6+0	6+1	6+2	6+3	6+4	6+5	6+6	6+7	6+8	6+9	6+10
7	7+0	7+1	7+2	7+3	7+4	7+5	7+6	7+7	7+8	7+9	7+10
8	8+0	8+1	8+2	8+3	8+4	8+5	8+6	8+7	8+8	8+9	8+10
9	9+0	9+1	9+2	9+3	9+4	9+5	9+6	9+7	9+8	9+9	9+10
10	10+0	10+1	10+2	10+3	10+4	10+5	10+6	10+7	10+8	10+9	10+10

Lower Key Stage 2 - Addition

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of addition. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve two-step addition problems in contexts, deciding which operations and methods to use and why.
Methods	Add numbers with up to 4 digits using the formal written methods of columnar addition where appropriate. Add numbers mentally, including: A three-digit number and ones. A three-digit number and tens. A three-digit number and hundreds.
Checking	Estimate and use inverse operations to check answers to a calculation.
Using number facts	Solve problems, including missing number problems, using number facts, place value and more complex addition.

Again begin with the CPA approach:

TO + TO using base 10. Continue to develop understanding of partitioning and place value. $36 + 25$ 	Children to represent the base 10 in a place value chart. 	Looking for ways to make 10. $36 + 25 =$ 30 + 20 = 50 5 + 5 = 10 50 + 10 + 1 = 61 1 5 Formal method: $\begin{array}{r} 36 \\ +25 \\ \hline 61 \\ 1 \end{array}$
---	---	---

Use of place value counters to add HTO + TO, HTO + HTO etc. When there are 10 ones in the 1s column we exchange for 1 ten, when here are 10 tens in the 10s column we exchange for 1 hundred.

Children to represent the counters in a place value chart, circling when they make an exchange.

Following a CPA approach using a calculation mat or other resources suited to specific cohorts, introduce the **column addition** method using with no exchanging for 2, 3 and 4 digit numbers.

Column addition example with no exchanging:

$$\begin{array}{r} 232 \\ + 43 \\ \hline 275 \end{array}$$

Column addition example with exchanging:

$$\begin{array}{r} \text{HTO} \\ 236 \\ + 73 \\ \hline 309 \\ 1 \end{array}$$

Remind children the actual value is **three tens** add seven tens which equals **ten tens**, not three add seven.

'Carry' numbers **underneath** the bottom line as exchanging when subtracting will be above the numbers.

Add the ones first.

Place value charts and calculation mats to be used, if needed, as visual aids and support tools in order to secure understanding of the addition process.

In addition to challenge through larger numerals, ensure challenge and deeper understanding are developed through 'variation' in the way addition problems are presented from here onwards.

Variation in Addition:

Once children can solve addition problems with 3 digit numbers, they can begin to apply this with 4 or more digits. However, once pupils have mastered addition up to and including 4-digits, it is important to ensure further challenge and deeper understanding are developed through 'variation' in the way addition problems are presented from here onwards.

Upper Key Stage 2 - Addition

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of addition. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve multi-step addition problems in contexts, deciding which operations and methods to use and why.
Methods	Add whole numbers with more than 4 digits, including using formal written methods. (columnar addition and subtraction) Add numbers mentally with increasingly large numbers.
Checking	Use rounding to check answers to calculations and determine, in the context of a problem, levels of accuracy.
Using number facts	Add negative integers.

Add numbers with more than 4-digits including money, measures and decimals with different numbers of decimal places.

$$\begin{array}{r} \text{£} 23.59 \\ + \text{£} 7.55 \\ \hline \text{£} 31.14 \end{array}$$

The decimal point should be aligned in the same way as the other place value columns, and must be in the same column in the answer.

Numbers should exceed 4 digits.

$$\begin{array}{r} 23481 \\ + 1362 \\ \hline 24843 \end{array}$$

$$\begin{array}{r} 19.01 \\ 3.65 \\ + 0.7 \\ \hline 23.36 \end{array}$$

Pupils should be able to add more than two values, carefully aligning place value columns.

Empty decimal places can be filled with zero to show the place value in each column.

Say '6 tenths add 7 tenths' to reinforce place value.

Children should:

Understand the place value of tenths and hundredths and use this to align numbers with different numbers of decimal places.

Add several numbers of increasing complexity.

2	3	.	3	6	1
	9	.	0	8	
5	9	.	7	7	
+	1	.	3		
9	3	.	5	1	1
2	1		2		

Adding several numbers with different numbers of decimal places (including money and measures):

- Tenths, hundredths and thousandths should be correctly aligned, with the decimal point

Empty decimal places can be filled with zero to show the place value in each column.

8	1	,	0	5	9
	3	,	6	6	8
	1	5	,	3	0
+	2	0	,	5	5
1	2	0	,	5	7
	1		1	1	1

Extend by adding several numbers with more than 4 digits.

Pupils should also be able to perform mental calculations including with mixed operations and larger numbers.

Subtraction in the Early Years Foundation Stage

- Say which number is one more or one less than a given number.
- Use objects to subtract two single-digit numbers by counting back to find the answer.

The first step into subtraction is to learn how to count backwards.

Children will then utilise this strategy to solve simple subtractions:

Subtract from numbers up to 10:

Subtracting by taking away

Using everyday problems and simple number sentences, children remove or cross out some objects in order to discover how many are left e.g.

$$8-2=6$$

There are 8 monkeys on a tree. 2 jump off. How many are left?

Counting back to find the answer

Using a simple number track or game board, children count backwards to find the answer e.g.:

$$10-4=$$

Mental subtraction:

Children should be able to quickly recall the number one less than any number to 10 and then beyond by the end of this stage.

Key Stage 1 - Subtraction

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of subtraction. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve one-step problems with subtraction: Using concrete objects and pictorial representations including those involving numbers, quantities and measures. Using the subtraction (-) and equals (=) signs. Applying their increasing knowledge of mental and written methods.
Methods	Subtract numbers using concrete objects, pictorial representations, and mentally, including: One-digit and two-digit numbers to 20, including zero. A two-digit number and ones. A two-digit number and tens. Two two-digit numbers. Adding three one-digit numbers. Show that addition of two numbers can be done in any order (commutative) and subtraction of one number from another cannot.
Checking	Recognise and use the inverse relationship between addition and subtraction and use this to check calculations and solve missing number problems.
Using number facts	Represent and use number bonds and related subtraction facts within 20. Recall and use addition and subtraction facts to 20 fluently, and derive and use related facts up to 100.

Within this milestone children should:

- Have multiple experiences embedding the CPA approach to ensure conceptual understanding.
- Have access to number tracks, number lines, dienes, place value counters, place value arrow cards, tens frame, Numicon, counting sticks, 100 squares, bar models and part whole models.
- Have access to a mathematical display highlighting the key vocab subtract, takeaway, take from, difference, count back, inverse, less than, fewer than, decrease by, deduct, reduce, minus, exchange.

Subtract from numbers up to 20

Children consolidate understanding of subtraction practically, showing subtraction on number lines, using cubes etc. and in familiar contexts. They are introduced to more formal recording including recording on a number line once secure with the practical concept of subtraction.

Concrete	Pictorial	Abstract
Physically taking away and removing objects from a whole (ten frames, Numicon, cubes and other items such as beanbags could be used). $4 - 3 = 1$ 	Children to draw the concrete resources they are using and cross out the correct amount. The bar model can also be used. 	$4 - 3 =$ 
Counting back (using number lines or number tracks) children start with 6 and count back 2. $6 - 2 = 4$ 	Children to represent what they see pictorially e.g. 	Children to represent the calculation on a number line or number track and show their jumps. Encourage children to use an empty number line 
Finding the difference (using cubes, Numicon or Cuisenaire rods, other objects can also be used). Calculate the difference between 8 and 5. 	Children to draw the cubes/other concrete objects which they have used or use the bar model to illustrate what they need to calculate. 	Find the difference between 8 and 5. $8 - 5$, the difference is Children to explore why $9 - 6 = 8 - 5 = 7 - 4$ have the same difference.
Making 10 using ten frames. $14 - 5$ 	Children to present the ten frame pictorially and discuss what they did to make 10. 	Children to show how they can make 10 by partitioning the subtrahend. $14 - 5 = 9$  $14 - 4 = 10$ $10 - 1 = 9$

Children should start recalling subtraction facts up to **and within** 10 and 20 by the end of year 1 and should be able to subtract zero.

Subtraction skills will be broken down into subtracting 2-digit numbers and tens and also subtracting 2-digit numbers and ones, ensuring children have a full understanding of the process using the appropriate resources and method.

Children to record subtraction by partitioning and recombining to get the answer:

$$38 - 14 =$$

$$30 - 10 = 20$$

$$8 - 4 = 4$$

(Recombine numbers to get answers)

If children are secure in this method, move onto expanded column subtraction.

Lower Key Stage 2 - Subtraction

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of subtraction. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve two-step subtraction problems in contexts, deciding which operations and methods to use and why.
Methods	Subtract numbers with up to 4 digits using the formal written methods of columnar subtraction where appropriate. Subtract numbers mentally, including: A three-digit number and ones. A three-digit number and tens. A three-digit number and hundreds.
Checking	Estimate and use inverse operations to check answers to a calculation.
Using number facts	Solve problems, including missing number problems, using number facts, place value and subtraction that is more complex.

Subtract with 2-digit numbers:

Mental subtraction

Many mental strategies are to be taught. Children should be taught to recognise that when numbers are close together, it is more efficient to **count on** the difference making 10/using a number line if needed. They need to be clear about the relationship between addition and subtraction.

$$42 - 38 = 4$$

Within this milestone children should:

- Have multiples experiences embedding the CPA approach to ensure conceptual understanding.
- Have access to number tracks, number lines, dienes, place value counters, place value arrow cards, tens frame, Numicon, counting sticks, 100 squares, bar models and part whole models.
- Have access to a mathematical display highlighting the key vocab subtract, takeaway, take from, difference, count back, inverse, less than, fewer than, decrease by, deduct, reduce, minus, exchange.

Subtracting with 2 and 3-digit numbers:

Introduce **partitioned column subtraction** method.

Step 1: Begin with a CPA approach for a calculation where no 'exchanging' is required e.g.:

Column method using base 10.
48 - 7

10s	1s

10s	1s
4	1

Children to represent the base 10 pictorially.

10s	1s
4	1

Column method or children could count back 7.

	4	8
-		7
	4	1

STEP 2: introduce 'exchanging' through practical subtraction. Make the larger number with dienes, then subtract 47 from it.

Column method using base 10 and having to exchange.
41 - 26

10s	1s

10s	1s

10s	1s
	5
1	5

Represent the base 10 pictorially, remembering to show the exchange

10s	1s
1	5

Formal column method. Children must understand that when they have exchanged the 10 they still have 41 because $41 = 30 + 11$.

	3 4	1
-	2	6
	1	5

When learning to 'exchange', explore 'partitioning in different ways' so that pupils understand that when you exchange, the **VALUE** is the same ie $72 = 70 + 2 = 60 + 12 = 50 + 22$ etc. Emphasise that the value has **n't** changed, we have just partitioned it in a different way.

72 - 47

=

$$\begin{array}{r}
 70 + 2 \\
 - 40 + 7 \\
 \hline
 20 + 5 = \underline{25}
 \end{array}$$

Before subtracting '7' from the 72 blocks, they will need to exchange a row of 10 for ten ones. Then

STEP 3: Use formal subtraction column method with exchanging.

$$\begin{array}{r}
 \overset{2}{2}\overset{1}{3}4 \\
 - \quad 88 \\
 \hline
 \quad \quad 6
 \end{array}$$

Subtract with up to 4-digit numbers

Partitioned column subtraction with 'exchanging' (decomposition): _____

Compact column subtraction

$$\begin{array}{r} 2754 \\ - 1562 \\ \hline 1192 \end{array}$$

Give plenty of opportunities to apply this to money and measures.

To introduce the compact method, ask children to perform a subtraction calculation with the familiar partitioned column subtraction then display the compact version for the calculation they have done. Ask pupils to consider how it relates to the method they know, what is similar and what is different, to develop an understanding of it

Always encourage children to consider the best method for the numbers involved—mental, counting on, counting back or written method

Mental strategies

A variety of mental strategies must be taught and practised, including counting on to find the difference where numbers are closer together, or where it is easier to count on.

Upper key stage 2 - Subtraction

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of subtraction. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve multi-step subtraction problems in contexts, deciding which operations and methods to use and why.
Methods	Subtract whole numbers with more than 4 digits, including using formal written methods. (columnar addition and subtraction) Subtract numbers mentally with increasingly large numbers
Checking	Use rounding to check answers to calculations and determine, in the context of a problem, levels of accuracy.
Using number facts	Subtract negative integers.

Subtract with at least 4-digit numbers including money, measures and decimals.

Compact column subtraction (with 'exchanging').

Subtracting with larger integers.

$$\begin{array}{r}
 \overset{2}{\cancel{3}} \overset{10}{\cancel{1}} \overset{0}{\cancel{0}} \overset{8}{\cancel{8}} \overset{6}{\cancel{6}} \\
 - \quad \quad 2 \quad 1 \quad 2 \quad 8 \\
 \hline
 2 \quad 8, \quad 9 \quad 2 \quad 8
 \end{array}$$

Children who are still not secure with number facts and place value will need to remain on the partitioned column method until ready for the compact method.

Subtract with decimal values, including mixtures of integers and decimals, aligning the decimal point.

$$\begin{array}{r}
 \overset{6}{\cancel{7}} \overset{10}{\cancel{1}} \overset{6}{\cancel{6}} \overset{8}{\cancel{8}} \cdot \overset{0}{\cancel{0}} \\
 - \quad \quad 3 \quad 7 \quad 2 \cdot 5 \\
 \hline
 6 \quad 7 \quad 9 \quad 6 \cdot 5
 \end{array}$$

Add a 'zero' in any empty decimal places to aid understanding of what to subtract in that column.

Subtracting with increasingly large and more complex numbers and decimal values.

$$\begin{array}{r}
 \overset{0}{\cancel{1}} \overset{14}{\cancel{5}} \overset{9}{\cancel{0}}, \overset{6}{\cancel{6}} \quad 9 \quad 9 \\
 - \quad \quad 8 \quad 9, \quad 9 \quad 4 \quad 9 \\
 \hline
 6 \quad 0, \quad 7 \quad 5 \quad 0
 \end{array}$$

Using the compact column method to subtract more complex integers

$$\begin{array}{r}
 \overset{1}{\cancel{1}} \overset{10}{\cancel{0}} \overset{5}{\cancel{5}} \cdot \overset{3}{\cancel{4}} \overset{1}{\cancel{1}} \quad 9 \text{ kg} \\
 - \quad \quad 3 \quad 6 \cdot 0 \quad 8 \quad \text{kg} \\
 \hline
 6 \quad 9 \cdot 3 \quad 3 \quad 9 \text{ kg}
 \end{array}$$

Using the compact column method to subtract money and measures, including decimals with different numbers of decimal places.

Pupils should be able to apply their knowledge of a range of mental strategies, mental recall skills, and informal and formal written methods when selecting **the most appropriate method** to work out subtraction problems.

Variation in subtraction

Children should be given frequent opportunities for variation in how problems are presented or, in how they may be expected to solve them.

For Example:

391	
186	?

Missing digit calculations

$$\begin{array}{r}
 39\Box \\
 - \Box\Box6 \\
 \hline
 \Box05
 \end{array}$$

= 391 - 186

$$\begin{array}{r}
 391 \\
 -186 \\
 \hline
 \hline
 \end{array}$$

What is 186 less than 391?

Raj spent £391, Timmy spent £186. How much more did Raj spend?

Calculate the difference between 391 and 186.

Multiplication: Early years Foundation Stage

Doubling

- Children need experience of solving everyday problems where double the quantity is needed (e.g. double the amount of toast, double the amount of forks at the dinner table or double the number of cups at snack time).
- Children may begin some quick recall of doubles facts such as, “Double 2 is 4,” through game playing e.g. roll a dice then double the number it lands on.

Key Stage 1 – Multiplication

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of multiplication. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve one-step (two-step at greater depth) problems involving multiplication.
Methods	Calculate mathematical statements for multiplication within the multiplication tables and write them using the multiplication (x) and equals (=) signs. Show that multiplication of two numbers can be done in any order (commutative). Solve problems involving multiplication using mental methods.
Checking	Use known multiplication facts to check the accuracy of calculations.
Using number facts	Recall and use multiplication facts for the 2, 5 and 10 multiplication tables. Recognise odd and even numbers. Use multiplication facts to solve problems.

Within this milestone children should:

- Have multiples experiences embedding the CPA approach to ensure conceptual understanding.
- Have access to number tracks, number lines, dienes, place value counters, place value arrow cards, tens frame, Numicon, counting sticks, 100 squares and bar models.

- Have access to a mathematical display highlighting the key vocab including multiply, multiplication, times, lots of, groups of, sets of, product, multiple, double, factors, repeated addition and distributive.

Multiply with concrete objects, arrays and pictorial representations:

How many legs will 3 teddies have?

There are 3 sweets in one bag.
How many sweets are in 5 bags altogether?

$$3+3+3+3+3 = 15$$

- Give children experience of counting equal group of objects in 2s, 5s and 10s
- Present practical problem solving activities involving counting equal sets or groups

Multiply using arrays and repeated addition (using at least 2s, 5s and 10s)

Use repeated addition on a number line:

Starting from zero, make equal jumps up on a number line to work out multiplication facts and write multiplication statements using x and = signs.

$$4 \times 5 = 20$$

Use practical apparatus and a CPA approach

Use arrays to illustrate commutativity counters and other objects can also be used. $2 \times 5 = 5 \times 2$ 2 lots of 5 5 lots of 2 $5 \times 3 = 5 + 5 + 5$	Children to represent the arrays pictorially.	Children to be able to use an array to write a range of calculations e.g. $10 = 2 \times 5$ $5 \times 2 = 10$ $2 + 2 + 2 + 2 + 2 = 10$ $10 = 5 + 5$
--	--	--

Use mental recall:

- Children should begin to recall multiplication facts for 2, 5 and 10 times tables and count in 3s through practice in counting and understanding of the operation.

The CPA approach in milestone 1 should look like this:

Concrete	Pictorial	Abstract
Repeated grouping/repeated addition 3×4 $4 + 4 + 4$ There are 3 equal groups, with 4 in each group. 	Children to represent the practical resources in a picture and use a bar model. 	$3 \times 4 = 12$ $4 + 4 + 4 = 12$
Number lines to show repeated groups- 3×4  Cuisenaire rods can be used too.	Represent this pictorially alongside a number line e.g: 	Abstract number line showing three jumps of four. $3 \times 4 = 12$ 

Lower Key Stage 2 – Multiplication

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of multiplication. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve problems involving multiplying, including using the distributive law to multiply two digit numbers by one digit, integer scaling problems and harder correspondence problems (such as n objects are connected to m objects).
Methods	Multiply two-digit and three-digit numbers by a one-digit number using formal written layout. Use place value, known and derived facts to multiply mentally, including: multiplying by 0 and 1; dividing by 1; multiplying together three numbers. Recognise and use factor pairs and commutativity in mental calculations.
Checking	Recognise and use the inverse relationship between multiplication and division and use this to check calculations and solve missing number problems.
Using number facts	Recall multiplication facts for multiplication tables up to 12×12 .

Multiply 2-digits by a single digit number

Begin with objects then record pictorially before more abstract recording

Partition to multiply using Numicon, base 10 or Cuisenaire rods. 4×15 	Children to represent the concrete manipulatives pictorially. 	Children to be encouraged to show the steps they have taken. 4×15 $10 \times 4 = 40$ $5 \times 4 = 20$ $40 + 20 = 60$ A number line can also be used 
---	--	---

Formal column method with place value counters (base 10 can also be used.) 3×23 <table border="1" data-bbox="207 795 422 974"> <thead> <tr> <th>10s</th> <th>1s</th> </tr> </thead> <tbody> <tr> <td>3 tens</td> <td>6 ones</td> </tr> </tbody> </table> 6 9	10s	1s	3 tens	6 ones	Children to represent the counters pictorially. 	Children to record what it is they are doing to show understanding. 3×23 $3 \times 20 = 60$ $20 \quad 3$ $3 \times 3 = 9$ $60 + 9 = 69$ 23 $\times 3$ 69
10s	1s					
3 tens	6 ones					

As a pre-step before formal column, grid method can be used, if required, to consolidate place value knowledge. It is up to the teacher to make the judgement whether the method is used or not.

Introduce the grid method for multiplying 2-digit by single-digits:
 Link the layout of the grid to an array initially:

Eg. $23 \times 8 = 184$

X	20	3
8	160	24

$160 + 24 = 184$

Introduce the grid method with children physically making an array to represent the calculation (e.g. make 8 lots of 23 with 10s and 1s place value counters), then translate this to grid method format

Work towards more formal by working through clear steps with place value counters (concrete resources), drawing (pictorial representation) eventually leading to more abstract written work.

Multiply 2 and 3-digits by a single digit, using all multiplication tables up to 12×12

Review and extend the Concrete, Pictorial and Abstract (CPA) approach. Apply this to three digit numbers.

Formal column method with place value counters. 6×23	Children to represent the counters/base 10, pictorially e.g. the image below.	Formal written method $ \begin{array}{r} 6 \times 23 = \\ 23 \\ \times 6 \\ \hline 138 \\ 11 \end{array} $
--	--	--

Eg. $136 \times 5 = 680$

X	100	30	6
5	500	150	30

The grid method may also develop-

$$\begin{array}{r}
 500 \\
 150 \\
 + 30 \\
 \hline
 680
 \end{array}$$

be
oped:

Encourage c
column addition
to add accurate-

Move onto **short multiplication** (see stage 5) if and when children are confident and accurate multiplying 2 and 3-digit numbers by a single digit this way, and are already confident in 'exchanging' for written addition.

Upper key stage 2 - Multiplication

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of multiplication. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve problems involving multiplication, including understanding the meaning of the equals sign. Solve problems involving multiplication, including scaling by simple fractions and problems involving simple rates. Use knowledge of the order of operations to carry out calculations involving the four operations.
Methods	Multiply multi-digit numbers up to 4 digits by a two-digit whole number using the formal written method of long multiplication. Perform mental calculations, including with mixed operations and large numbers.
Checking	Estimate and use inverse operations and rounding to check answers to a calculation.
Using number facts	Identify common factors, common multiples and prime numbers. Establish whether a number up to 100 is prime and recall prime numbers up to 19. Multiply whole numbers and those involving decimals by 10, 100 and 1000. Recognise and use square numbers and cube numbers, and the notation for squared (2) and cubed (3). Solve problems involving multiplication, including using knowledge of factors and multiples, squares and cubes.

Multiply up to 4-digits by 1 or 2 digits.

Introducing column multiplication

- Introduce by comparing a grid method calculation to a short multiplication method, to see how the steps are related, but notice how there are less steps involved in the column method
- Children need to be taught to approximate first, e.g. for 72×38 , they will use rounding: 72×38 is approximately $70 \times 40 = 2800$, and use the approximation to check the reasonableness of their answer against.

Short multiplication for multiplying by a single digit

Pupils could be asked to work out a given calculation using the grid, and then compare it to 'your' column method. What are the similarities and differences?

Unpick the steps and show how it reduces the steps needed.

x	300	20	7
4	1200	80	28

Move from a grid method to an expanded column method.

		3	2	7	
	x			4	
			2	8	
			8	0	
	1	2	0	0	
	1	3	8	0	

	3	2	7
x			4
	1	3	0
	8		

18 x 3 on the 1st row (8 x 3 = 24, exchanging the 2 for twenty, then '1' x 3).

18 x 10 on the 2nd row. Put a zero in ones first, then say 8 x 1, and 1 x 1.

	10	8
10	100	80
3	30	24

		1	8
	x	1	3
		5	4
		2	
	1	8	0
	2	3	4

The grid could be used to introduce long multiplication, as the relationship can be seen in the answers in each row.

Introduce long multiplication for multiplying by 2 digit:

	1	2	3	4
x			1	6
	7	4	0	4
1	2	3	4	0
	1	9	7	4

(1234 x 6)
(1234 x 10)

Moving onto more complex numbers:

	3	6	5	2
x				8
	2	9	2	1
	5	4		

Short and long multiplication as in Stage 5, and multiply decimals with up to 2d.p by a single digit.

	3	.	1	9
x	8			
	2	5	.	5
		1		7

Remind children that the single digit belongs in the ones column.

Line up the decimal points in the question and the answer.

This works well for multiplying money (£.p) and other measures.

Children will be able to:

- Use rounding and place value to make approximations before calculating and use these to check answers against.
- Use short multiplication (see ARE 5) to multiply numbers with more than 4-digits by a single digit; to multiply money and measures, and to multiply decimals with up to 2d.p. by a single digit.
- Use long multiplication (see ARE 5) to multiply numbers with at least 4 digits by a 2-digit numbers.

Variation in Multiplication

Children should be given frequent opportunities for variation in how problems are presented or, in how they may be expected to solve them. An ability to solve problems in a variety of ways deepens children's understanding.

Some examples include:

23	23	23	23	23	23
?					

Mai had to swim 23 lengths, 6 times a week.
How many lengths did she swim in one week?
With the counters, prove that $6 \times 23 = 138$

Find the product of 6 and 23

$6 \times 23 =$

$\square = 6 \times 23$

6	23
$\times 23$	$\times 6$
—	—

What is the calculation?
What is the product?

100s	10s	1s
		

Early Years Foundation Stage - Division

Solve practical problems involving halving and sharing

Halving:

How many cakes on the plate?
Take half of them off.

How many did you take off?
How many are left?

Other questions might include: Put half of: the sheep in the field... the cars in the garage...the dinosaurs in the forest... the animals in the zoo...

Find half a group of objects by
sharing into 2 equal groups.

Share a group of objects
fairly between themselves and
others

Can you share the
biscuits out between
the teddies? How many
biscuits does each

Key Stage 1 - Division

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of division. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve problems involving division, including using the distributive law to divide two digit numbers by one digit, integer scaling problems and harder correspondence problems (such as n objects are connected to m objects).
Methods	Dividing -digit and two-digit numbers by a one-digit number using formal written layout. Use place value, known and derived facts to divide mentally, including: dividing by 1; dividing together three numbers.
Checking	Recognise and use the inverse relationship between multiplication and division and use this to check calculations and solve missing number problems.
Using number facts	Recall division facts for multiplication tables up to 12×12 .

Group and share small quantities:

Using objects, diagrams and pictorial representations to solve problems involving both grouping and sharing.

How many groups of 4 can be made with 12 stars? = 3

Grouping:

Sharing:

Pupils should:

Use lots of practical apparatus, arrays and picture representations

Be taught to understand the difference between 'grouping' objects (How many groups of 2 can you make?) and 'sharing' (Share these sweets between 2 people)

Concrete	Pictorial	Abstract		
Sharing using a range of objects. $6 \div 2$ 	Represent the sharing pictorially. 	$6 \div 2 = 3$ <table border="1"><tr><td>3</td><td>3</td></tr></table> Children should also be encouraged to use their 2 times tables facts.	3	3
3	3			

Group and share, using the $\div$ and $=$ sign

Use objects, arrays, diagrams and pictorial representations, and grouping on a number line.

Arrays:

This represents $12 \div 3$, posed as how many groups of 3 are in 12?

Pupils should also show that the same array can represent $12 \div 4 = 3$ if grouped horizontally.

To know and understand sharing and grouping:

There are 6 sweets, how many people can have 2 sweets each?

Lower Key Stage 2 - Division

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of division. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve problems involving division, including using the distributive law to divide two digit numbers by one digit, integer scaling problems and harder correspondence problems (such as n objects are connected to m objects).
Methods	Dividing two-digit and three-digit numbers by a one-digit number using formal written layout. Use place value, known and derived facts to divide mentally, including: dividing by 0 and 1; dividing by 1; dividing into three numbers. Recognise and use factor pairs and commutativity in mental calculations.
Checking	Recognise and use the inverse relationship between multiplication and division and use this to check calculations and solve missing number problems.
Using number facts	Recall division facts for multiplication tables up to 12×12 .

Divide 2-digit numbers by a single digit:

$2d \div 1d$ with remainders using lollipop sticks. Cuisenaire rods, above a ruler can also be used.
 $13 \div 4$

Use of lollipop sticks to form wholes- squares are made because we are dividing by 4.

There are 3 whole squares, with 1 left over.

Sharing using place value counters.
 $42 \div 3 = 14$

Children to represent the lollipop sticks pictorially.

There are 3 whole squares, with 1 left over.

$13 \div 4 = 3$ remainder 1

Children should be encouraged to use their times table facts; they could also represent repeated addition on a number line.

'3 groups of 4, with 1 left over'

Children to represent the place value counters pictorially.

Children to be able to make sense of the place value counters and write calculations to show the process.

$$\begin{aligned}
 42 \div 3 &= 14 \\
 42 &= 30 + 12 \\
 30 \div 3 &= 10 \\
 12 \div 3 &= 4 \\
 10 + 4 &= 14
 \end{aligned}$$

Short division:

Limit numbers to **NO** remainders in the answer **OR** carried

STEP 1: Once children are secure with division as grouping and demonstrate this using number lines, arrays etc., **short division** for larger 2-digit numbers should be introduced, initially with carefully selected examples requiring no calculating of remainders at all.

Remind children of correct place value, that 96 is equal to 90 and 6, but in short division, pose:

How many 3's in 9? = 3, and record it above the 9 tens.

How many 3's in 6? = 2, and record it above the 6 ones.

$$\begin{array}{r} 32 \\ 3 \overline{)96} \end{array}$$

Short division:

Limit numbers to **NO** remainders in the final answer, but with remainders occurring within the calculation to be carried to the next digit.

STEP 2: Once children demonstrate a full understanding of remainders using non formal methods, and also the short division method taught, they can be taught how to use the method when remainders occur within the calculation (e.g. $96 \div 4$), and be taught to 'carry' the remainder onto the next

Step 3 must only be taught when pupils can calculate 'remainders'.

$$\begin{array}{r} 18 \\ 4 \overline{)72} \end{array}$$

Divide up to 3-digit numbers by a single digit (without remainders initially).

Short division using place value counters to group.
 $615 \div 5$

100s	10s	1s
		
1	2	3

1. Make 615 with place value counters.
2. How many groups of 5 hundreds can you make with 6 hundred counters?
3. Exchange 1 hundred for 10 tens.
4. How many groups of 5 tens can you make with 11 ten counters?
5. Exchange 1 ten for 10 ones.
6. How many groups of 5 ones can you make with 15 ones?

Represent the place value counters pictorially.

Continue to develop short division:

$$\begin{array}{r} 218 \\ 4 \overline{) 872} \end{array}$$

Pupils move onto dividing numbers with up to **3-digits** by a single digit, however problems and calculations provided should **not result in a final answer with remainder** at this stage.

$$\begin{array}{r} 037 \\ 5 \overline{) 185} \end{array}$$

When the answer for the **first column** is zero ($1 \div 5$, as in example), children could initially write a zero above to acknowledge its place, and must always 'carry' the number (1) over to the next digit as a remainder.

Include money and measure contexts when confident.

Upper key stage 2 - division

Within this milestone, children will be working through three different levels of understanding, depending on their knowledge of the concept. The first generating an overall basic understanding of the concepts within the milestone, progressing onto a more advanced level of understanding, resulting in a deep knowledge and application of division. Children will be able to apply their knowledge and understanding within a wide range of contexts.

Complexity	Solve problems involving addition, subtraction, multiplication and division and a combination of these, including understanding the meaning of the equals sign. Solve problems involving division, including scaling by simple fractions and problems involving simple rates. Use knowledge of the order of operations to carry out calculations involving the four operations.
Methods	Divide numbers up to 4 digits by a two-digit whole number using the formal written method of long division, and interpret remainders as whole number remainders, fractions, or by rounding, as appropriate for the context. Perform mental calculations, including with mixed operations and large numbers.
Checking	Estimate and use inverse operations and rounding to check answers to a calculation.
Using number facts	Divide whole numbers and those involving decimals by 10, 100 and 1000. Recognise and use square numbers and cube numbers, and the notation for squared (2) and cubed (3). Solve problems involving multiplication and division including using knowledge of factors and multiples, squares and cubes.

Divide up to 4 digits by a single digit, including those with remainders.

Short division, including remainder answers:

$$\begin{array}{r} 0663 \text{ r } 5 \\ 8 \overline{) 5309} \end{array}$$

Short division with remainders: Now that pupils are introduced to examples that give rise to remainder answers, division needs to have a real life problem solving context, where **pupils consider the meaning of the remainder and how to express it**, as a fraction, a decimal, or as a rounded number or value, depending upon the context of the problem.

The answer to $5309 \div 8$ could be expressed as 663 and five eighths, 663 r 5, as a decimal, or rounded as appropriate to the problem involved.

Divide at least 4 digits by both single-digit and 2-digit numbers (including decimal numbers and quantities).

Long division using place value counters
 $2544 \div 12$

We can't group 2 thousands into groups of 12 so will exchange them.

We can group 24 hundreds into groups of 12 which leaves with 1 hundred.

$$\begin{array}{r} 02 \\ 12 \overline{) 2544} \\ \underline{24} \\ 1 \end{array}$$

After exchanging the hundred, we have 14 tens. We can group 12 tens into a group of 12, which leaves 2 tens.

$$\begin{array}{r} 021 \\ 12 \overline{) 2544} \\ \underline{24} \\ 14 \\ \underline{12} \\ 2 \end{array}$$

After exchanging the 2 tens, we have 24 ones. We can group 24 ones into 2 group of 12, which leaves no remainder.

$$\begin{array}{r} 0212 \\ 12 \overline{) 2544} \\ \underline{24} \\ 14 \\ \underline{12} \\ 24 \\ \underline{24} \\ 0 \end{array}$$

Short division, for dividing by a single digit: e.g. $6497 \div 8$

$$\begin{array}{r} 0812.1 \\ 8 \overline{) 6497.0} \end{array}$$

Short division with remainders: Pupils should continue to use this method, but with numbers to at least 4 digits, and understand how to express remainders as fractions, decimals, whole number remainders, or rounded numbers. Real life problem solving contexts need to be the starting point, where pupils have to consider the most appropriate way to express the remainder.

Calculating a decimal remainder: In this example, rather than expressing the remainder as r 1, a decimal point is added after the ones because there is still a remainder, and the one remainder is carried onto zeros after the decimal point (to show there was no decimal value in the original number). Keep dividing to an appropriate degree of accuracy for the problem being solved.

Introduce long division for dividing by 2 digits.

	Quotient
Divisor	Dividend

3	6	9	7	2	

1. If the divisor is bigger than 12 then list the multiples of that number by doubling etc. e.g.

$1 \times = 36$
 $2 \times = 72$
 $3 \times = 108$
 $4 \times = 144$
 $5 \times = 180$

		0	2	7	
3	6	9	7	2	
		7	2	↓	
		2	5	2	

2. Set out the calculation as in the 'bus stop method'

3. Look at the largest column of the dividend and see if that column is divisible by the divisor (e.g. 9 in the example here). If not, use the next column to help (e.g. 7 in the example here - looking at this number as if it is now 97).

4. Place the total number of groups that you get from this calculation (e.g. $97 \div 36 = 2$ groups, with a remainder of 25)

5. Multiply the total number of groups in step 4 by the divisor (e.g. $2 \times 36 = 72$) and write the answer underneath the first two columns.

6. Subtract the 72 from the 97 to show the remainder - lining the remainder up underneath.

7. Of the dividend, you will have one or more unused digits (number 2 in the example) which you bring down next to the remainder (25) to create the new number "252". This number now becomes the dividend and you now see how many groups of the divisor go into that group.

	£	0	2	.	3	5
3	2	7	5	.	2	0
	-	6	4		↓	
		1	1		2	
	-		9		6	
			1		6	0

Step 7 (above) may be repeated several times depending on the number of digits in the dividend and the context of the problem. If it is money/a decimal problem, columns of zeros may be needed to bring down. You will be left with a single digit remainder, depending on the contexts of the problem (as in the example here).

When dropping down digits to join the remainder, treat this as a whole number, ignoring the decimal for this part of the problem but ensuring it remains in the bus stop (i.e. the decimal must remain in the quotient and dividend line)

The following acronym may help with remembering which steps to take in long division problems:

Variation in Division

Children should be given frequent opportunities for variation in how problems are presented or, in how they may be expected to solve them. An ability to solve problems in a variety of ways deepens children's understanding.

These examples are taken from the White Rose calculation policy showing different ways to ask children to solve $615 \div 5$, but is equally applied to larger values:

Using the part whole model below, how can you divide 615 by 5 without using short division?

$$5 \overline{) 615}$$

$$615 \div 5 =$$

$$\boxed{} = 615 \div 5$$

I have £615 and share it equally between 5 bank accounts. How much will be in each account?

615 pupils need to be put into 5 groups. How many will be in each group?

What is the calculation?
What is the answer?

100s	10s	1s

Also include money and measure contexts.

Please see the Essentials curriculum for additional curriculum coverage and milestone indicators for the following areas:

- Fractions
- Understanding the properties of shape
- Measures
- Statistics
- Algebra
